## Silently Installing the Cisco Unified Presenter Add-In on End-User Computers

This section describes how to use an automated distribution system, such as the Microsoft Systems Management Server (SMS), to remotely distribute and install the Cisco Unified Presenter Add-In.

By default, the system prompts end users to download and install the Cisco Unified Presenter Add-In the first time that they try to share content during a meeting. However, to simplify the process for end users, you can silently install the Cisco Unified Presenter Add-In onto their computers by using the following switches:

- **SILENT** - Does not display the wizard or the background window but does display the installation progress window.
- **VERYSILENT** - Does not display the wizard window, the background window, or the installation progress window.

### Before You Begin

Ensure that all end users have installed the Adobe Flash Player.

### Restriction

Cisco Systems does not provide technical support for automated distribution tools.

### Procedure

1. Download the Cisco Unified Presenter Add-In file called Setup.exe from the home page of the Cisco Unified MeetingPlace Web Server.
2. Upload the Cisco Unified Presenter Add-In file to your corporate distribution software site.
3. Run the executable by entering **setup.exe /silent**
4. To test the switches, do the following:
  1. Click **Start > Run**, and enter `<path_to_setup.exe> /silent`.
  2. Verify that no user prompts appear on the end user machine.
