

### Restrictions

- You cannot disable SSL for only one web interface, such as the End-User Interface, Administration Center, or web conferencing. Completing this task disables SSL completely for the system.

**Note:** You can also disable SSL from the CLI. See the [SSLUtil](#).

### Procedure

1. Log in to Cisco Unified MeetingPlace Express and click **Administration**.
2. Do one of the following:
  - ◆ To disable SSL for the primary server, click **Certificate Management > Disable SSL**.
  - ◆ To disable SSL for the secondary server, click **System Configuration > SMA Configuration > SMA Certificate Management > SMA Disable SSL**.  
If SSL is already disabled, the Cisco Unified MeetingPlace Express system displays a message stating that SSL is already disabled for the End-User Interface, Administration Center, and web conferencing.
3. Click **Disable SSL**. The system displays a message stating that disabling SSL interrupts system operations and stops all meetings in progress. To disable SSL, you must restart the server.
4. Restart the server by clicking **Restart**.
