This page is used to add a video type.

Table: Fields on the Add Video Type Page

Field	Description	Values
Video Type Name	Name of this video type. This name is used on the user configuration pages and must be unique.	0-32 characters
Min Bit Rate	The minimum video bit rate that will be assigned to meetings using this type. This is used to prevent endpoints from establishing a video session with a low bit rate which could degrade the quality of the meeting.	64 / 192 / 384 / 768 Default: 64
Max Bit Rate	The maximum bit rate at which a video caller can connect to the system. Limiting the maximum bit rate allows the system administrator to maximize the number of video connections. If the administrator increases the maximum bit rate, the number of available video ports is linearly reduced. For example, if the maximum bit rate is doubled, then the number of video ports is reduced by half. When a user schedules a meeting, the system reserves ports at the rate specified by the Max Bit Rate parameter. Meeting participants cannot join at a rate higher than the value of the Max Bit Rate parameter. If a participant joins at a rate lower than the value of the Max Bit Rate , the system retains the additional SRUs allowing additional participants to join the meeting. Only signaled rates are taken into account. Flow-controlled bitrates are not taken into account. For example, if a meeting was scheduled with a maximum bit rate of 768 Kbps, and a caller joins at that rate and is later flow-controlled to a lower rate, the unused capacity is not returned to the system.	64 / 192 / 384 / 768 Default: 384
Codec	The video codec associated with this video type.	H.263 / H.264 Default: H.263
SRU cost	The resource cost for using this video type. The cost is based on the Max Bit Rate .	1 (for Max Bit Rate values of 64, 192, and 384)

		2 (for <u>Max Bit Rate</u> value of 768) Default: 1
Note	Section for notes about this video type.	0-255 characters Default: blank
