This page is used to add a translation rule to the ANI digit match table used by the auto-attend feature.

Field	Description	Value
Description	Description of this rule.	1 to 50 alphanumeric characters
Digits to Match	<p>Number of digits that must be in the ANI in order for this rule to be applied.</p> <p>If this value is set to 0, this field is ignored. That is, the ANI can have any number of digits and this rule will still be applied.</p> <p>Example: If the ANI is 2345 and this field is set to 4, apply this rule, because 2345 is comprised of 4 digits. If the ANI is 23456, do not apply this rule because 23456 is comprised of 5 digits.</p>	0-24
Match String	<p>Apply this rule if this string matches the beginning of the ANI digits.</p> <p>This string is removed from the ANI.</p> <p>Example: If this field is set to 23, and the ANI is 2345, remove the 23 to make the modified ANI equal to 45.</p>	0-32 alphanumeric characters
Replace By	<p>Insert these digits at the beginning of the ANI.</p> <p>Example: If this field is set to 789, the ANI is now 78945.</p>	0-32 alphanumeric characters
