

Cisco Unified Survivable Remote Site Voicemail (SRSV) is a survivable voicemail solution that works in conjunction with Cisco Unified Survivable Remote Site Telephony (SRST) in order to provide voicemail service to a branch site when connectivity to a central voicemail service is lost.

SRSV provides many voicemail and auto attendant features that are kept synchronized with the central voicemail service so that in the event of a failure the SRSV solution is ready to provide voicemail service to subscribers on the branch site. Upon restoration of networking, any voicemails received by subscribers are automatically uploaded to the central voicemail service.

The following SRSV features are documented on the Cisco DocWiki.

- [Cisco Unified Survivable Remote Site Voicemail -- Auto Attendant Design](#)
- [Cisco Unified Survivable Remote Site Voicemail -- Troubleshooting](#)
