## Getting the Latest WADL

The WADL (Web Application Description Language) defines and describes a REST web-service API, in this case the Connection Provisioning Interface API. Each version of Unity Connection 7.1(3) and later has an application.WADL file that can be downloaded from it for the version of Connection installed. It can be found using the following URL:

http:// {Connection server} /vmrest/application.wadl

You will need to authenticate as an administrator to gain access to it
