

Configuration examples should have consistent content. The following guidelines can help you create a configuration example.

Contents

- [1 Creating your Configuration Example Page](#)
- [2 Topology](#)
- [3 Configuration Output](#)
- [4 Categories](#)

Creating your Configuration Example Page

Type the name of your configuration example into the **search** box. Use the following syntax:

<product name> <feature/description> Configuration Example

For example, "Cisco Unity Express Networking with Direct IP Addressing Configuration Example"

If the example does not exist, you will be prompted to create a page. Copy the source code at [Template:Configuration Example](#) to your new page to develop your content.

 **Note:** This template contains details that might not be applicable to your example. Please edit at your discretion.

Topology

The topology that you upload should be a JPEG or GIF file. Many tools provide icons for topologies. Cisco also provides icons at the [Marketing Library](#).

Configuration Output

 **Caution:** Make sure that you scrub the IP addresses, domain names, and any other sensitive information. Examples of clean content are shown at [DocWiki:No Proprietary Information](#).

Examples should use preformatted text. Put your example in the following format:

```
<pre>Your configuration example text</pre>
```

Categories

Categories for Configuration Examples differ slightly from a regular article. For the most part, the paths for the categories are the same as for Cisco Products (see [DocWiki:Categories](#)). An additional layer of categories is placed right above the article so that Configuration Examples can be grouped together. See the following flow:
