

## Call Server CPU spikes to 90%-100%

<b>Problem Summary</b>	During the installation process, the Call Server CPU shows high utilization and spikes to 90%-100%.
<b>Error Message</b>	Error logs on the outprocess service indicating terminateConnection:Transport Down every 5-6 seconds.
<b>Possible Cause</b>	This occurs if there is an outprocess service (for example a VXML Server, REP Server or ORM) which does not have the correct version of cvp-common.jar. This can happen, if the CallServer or any other component is uninstalled and the CVP_HOME folder is not deleted after the uninstall. Re-installing the component, does not delete the cvp.war file or overwrite it.
<b>Recommended Action</b>	Ensure all components have the correct versions installed and the cvp-common.jar file is consistent on all components. Re-installing the correct build on all services is the right way to correct this problem.
<b>Release</b>	Release 7.0(2)
<b>Associated CDETS #</b>	None.
