Introduction

The following examples show point-to-multipoint traffic engineering configurations on the following routers:

- Headend router (PE5)
- Midpoint router (P1)
- Tailend router (PE1)

Design

Configuration

Configuration of the Headend Router (PE5): Example

In the following example configuration of the headend router, note the following:

- IPv4 multicast routing is enabled with the **ip multicast-routing** command.
- Two destination lists are specified, one for dynamic paths and one for explicit paths. The destination list specifies one path-option per destination.
- The **tunnel mode mpls traffic-eng point-to-multipoint** command enables the P2MP tunnel.
- On the tunnel interfaces, the **ip pim passive** command is used.
- On the non-MPLS interfaces, the **ip pim sparse-mode** command is used.
- The **ip igmp static-group** commands map the multicast groups to the P2MP tunnel.
- Fast Reroute is enabled on the router, with tunnel 3 as the backup path. An explicit path called PE5->P1-BKUP provides the alternative path.

next-address 172.16.0.15
next-address 172.16.192.2
```

Configuration of the Midpoint Router (P1): Example

In the following example configuration of the midpoint router, note the following:

- MPLS Traffic Engineering is enabled both globally and on the interface connecting to other core routers.
- MPLS TE extensions are enabled through the **mpls traffic-eng router-id** and **mpls traffic-eng level** commands.

```
hostname [P1]

```

Configuration of the Tailend Router (PE1): Example

In the following example configuration of the tailend router, note the following:

- IPv4 multicast routing is enabled with the **ip multicast-routing** command.
- On the non-MPLS interfaces, the **ip pim sparse-mode** command is used.
- The **ip multicast mpls** commands enable multicast routing of traffic.
