

Errors During Reporting Server Database Purge

Problem Summary	If you attempt to run a database purge on the reporting server when another purge is already in progress, or if the reporting server is down, the following messages appear in the log.
Error Message	<p>createClientSocket -- Couldn't get I/O streams for the socket.</p> <p>Error creating the client socket.</p> <p>Error sending a Start message to Reporting Server.</p> <p>Error sending an End message to Reporting Server.</p>
Possible Cause	The reporting server could not open a socket connection to itself, either because it was down or a purge process was in progress.
Recommended Action	No action necessary. This condition and the associated messages do not prevent the back-end task from completing the purge process.
Release	Release 7.0(2)
Associated CDETS #	None.
