

## Errors During Reporting Server Database Purge

<b>Problem Summary</b>	If you attempt to run a database purge on the reporting server when another purge is already in progress, or if the reporting server is down, the following messages appear in the log.
<b>Error Message</b>	<p>createClientSocket -- Couldn't get I/O streams for the socket.</p> <p>Error creating the client socket.</p> <p>Error sending a Start message to Reporting Server.</p> <p>Error sending an End message to Reporting Server.</p>
<b>Possible Cause</b>	The reporting server could not open a socket connection to itself, either because it was down or a purge process was in progress.
<b>Recommended Action</b>	No action necessary. This condition and the associated messages do not prevent the back-end task from completing the purge process.
<b>Release</b>	Release 7.0(2)
<b>Associated CDETS #</b>	None.
