

Restart_VXML_Server_using_Windows_services_management

The VXML server is actually a service running on the CVP server. You can restart the VXML server by restarting the VXML service from Windows Services management on the CVP server as follows

1. Access Windows Services management: **My Computer (rt click) > Manage > Services and Applications > Services.**
2. Highlight **Cisco CVP VXML Server.**
The service's description displays to the left of the entry.
3. Within the description, click **Restart.**

Note: This method will restart the service more quickly than restarting it through the Operations Console using **System > Control Center.**
