

Talk: Cisco_Unity_Connection_Provisioning_Interface_(CUPI)_API_--_Index_of_All_CUPI_Documentation

Not mentioned here is the ability to manipulate MessageHandlers ("Message Actions" in the CUAdmin interface) using the CUPI API. Tested against Unity Connection 8.5.1, the methods are GET to read the current Message Actions for a user and PUT to update them. The enumerated options for each type of message (voicemail, e-mail, fax, receipt) are

- 0 - Reject the message
- 1 - Accept the message
- 2 - Relay the message
- 3 - Accept and relay the message

The path to the MessageHandlers is /vmrest/users/<object ID>/messagehandlers
