

## Talk:OpenStack\_Havana\_Release:\_High-Availability\_Manual\_Deployment\_Guide

A small comment if I may - I was going through the manual installation today. and came across a problem with RabbitMQ

You are creating a listener for port 5672 on the VIP. Unfortunately the installation I performed today of RabbitMQ when starting would try and attach to all interfaces on the node - including that of the VIP - and hence would fail.

There seemed to be no config file for rabbit - why I do not know - and all the variables were loaded from /usr/lib/rabbitmq/bin/rabbitmq-server

Changing the NODE\_IP\_ADDRESS to only listen on a specific IP solved my problem.

Thanks
