

Talk:Virtualization_for_Cisco_Unified_Communications_Manager_(CUCM)

Regarding the VM requirements for Enterprise Licence Manager (ELM), this docwiki page states that standalone ELM requires the same resource as a 1000 user OVA template. So 2 x vCPUs, 4GB vRAM and 80GB vDisk. I think this is incorrect. Wouldn't standalone ELM use a single vCPU on UCS (Medium TRC) servers and above? As we can't have standalone ELM on UCS Small and Small+ servers, it would make more sense for the comment in the 9.1 and 9.0 tables to say - "Same as Unified CM 2500 users VM configuration for all deployments of standalone ELM"

Thanks, Pete
