

System CLI: System mode takes a long time for initialization on first attempt or "system init"

Problem Summary	System mode takes a long time to complete on the first attempt or after issuing the "system init" command.
Error Message	No specific error message.
Possible Cause	In general, this process takes a long time as the System CLI needs to access each device on the device list to authenticate access and obtain initialization data. The wait could be magnified if there are a lot of devices in the device list are offline. The System CLI has to wait for network timeout when connect to these offline devices.
Recommended Action	Make sure devices on the device list are online and take offline devices off the device list. Device list contains devices configured in the Operation Console.
Release	8.0(1)
Associated CDETS #	None.
