

You_hear_a_TTS_response_instead_of_holdmusic.wav_when_you_call_customhelloworld_DN

Problem Summary	You call the customhelloworld DN and instead of the expected holdmusic.wav response, you hear the TTS response you created earlier.
Error Message	NA
Possible Cause	NA
Recommended Action	You left the original TTS response typed into the TTS box of the audio element (as suggested). The application first attempts to locate and play the designated audio file. When it cannot do so, it attempts the text response. Because it is playing the text response, you know that customhelloworld is working. However, the URI you entered is probably incorrect.
Release	NA
Associated CDETS #	None.
